

Tru-Joint Glass Block Spacers

The Tru-Joint Glass Block Spacer is a reusable spacing system for controlling the thickness of mortar joints in the construction of glass block panels. It allows for fast installation and provides precise, uniform joints in both flat and curved walls. It works with standard or special shaped blocks and will preserve a wall's fire rating when that is a necessity. The joint spacers help to keep the panels plumb and level while preventing shifting and mortar buildup.
