

Terramats (Terra Mats) Portable Road Mats for Temporary Roadways

Terramats are portable, reusable road mats made from scrap truck tires, used to construct temporary roadways. They recycle a troublesome waste into a useful product that reduces erosion of earth surfaces. Terramats enable users to work during inclement weather and to cross wetlands, farm land, and archaeological sites while protecting the ground beneath the mat from rutting, compaction and erosion. Terramats are used in the construction, logging, cross country piping, oil, gas, mining, and recreational industries.
