Steel-Wood Composite Bridge

ToolWatch is a tool tracking and management system that uses a portable, shirt pocket sized bar code scanning pen and easy to use PC software. Tools and equipment identified with bar code labels can be scanned with the ToolWatch pen when handed out or moved from one site to another. Periodically, the scanning pen is placed in a docking station to recharge the pen and to transfer all tool transaction information to the PC. Once the transaction information is transferred to the PC, the tool manager can view the information and determine the status and location of every tool or piece of equipment along with he date and time it was assigned to a project or an employee or returned to the manager's control.
